U.S. AGRICULTURAL EXPORTS

Importance of Exports to the Farm Sector

Since the early 1970's, U.S. agriculture has devoted more of its resources to, and generated a greater share of income from the export market. Today, production from two out of every five acres goes overseas, compared with one out of five in 1970. The value of farm exports as a share of marketings has doubled in the past 10 years and currently represents about 25 percent of farmers' cash receipts. It is becoming more apparent that domestic demand alone cannot support the U.S. farm sector when it is operating at full capacity. Exports are crucial to the economic health and well-being of American agriculture.

Prices and income received by farmers have been responsive to changes in exports over the years, and this is nowhere more clearly illustrated than during the 1970's. The two major export booms—first in 1972/73 then again in 1978/79 through 1980/81—were closely paralleled by substantial farm price increases. The rapid growth in foreign demand allowed U.S. farmers to take land formerly setaside and put it back into production, thereby reducing government expenditures on supply—control and income—support measures. During the past two years export demand has slackened, contributing to the current problems of excess stocks and the subsequent acreage reduction program in 1983. This illustrates the importance of changes in export markets to the U.S. farm economy.

Exports are particularly important to selected sectors of the farm economy. Sixty percent of wheat and rice production, over half of soybeans and cotton, and a third of corn, sorghum and tobacco, are exported. In contrast, only 1 percent of U.S. meat production and 5 percent of fruit and vegetable production enters export channels.

Farm Exports in the U.S. Economy

Every dollar of agricultural export earnings generates just over a dollar in related activity throughout the rest of the economy. Processing, packaging, handling, transportation, and marketing are a few of the areas that have benefitted from export expansion. Approximately 3 percent of the Gross National Product is derived from farm exports. On the employment side, agricultural exports generate over 1.0 million jobs of which nearly 60 percent are related to processing, handling and distribution of products for export.

Bulk grains and oilseeds make up 80 to 85 percent of U.S. agricultural exports. These are land intensive crops that require the efficient use of land and machinery in order for any one farmer—and the United States in general—to remain competitive. This, in turn, tends to lower unit production costs, which leads to lower food prices for the consumer. As a result, the U.S. consumer spends, on average, just over 13 percent of personal disposable income on food compared with 17 to 24 percent in Western Europe, 35 percent in the Soviet Union, 40 percent in Mexico, and 55 percent in India.

Mainstay of U.S. International Position

Agricultural exports account for approximately one-fifth of total U.S. exports—more than any other single major product grouping. A record \$43.8 billion of farm products was exported in 1981. The efficiency and capability of the U.S. farm sector is more striking when one looks at net trade. The surplus of agricultural exports over imports climbed to nearly \$27 billion in 1981 compared with a deficit of \$56 billion in the nonagricultural sector. Alternatively, the U.S. agricultural trade surplus was equivalent to 40 percent of our imported oil that year. In addition, 40 to 50 percent of U.S. agricultural imports—items such as coffee, cocoa, rubber, bananas, and tea—are products that we do not produce, and therefore do not detract from U.S. output. Yet jobs are provided in handling, processing, and distribution just as they would a domestically produced commodity.

U.S. agricultural exports serve humanitarian and political interests as well as those of producers and consumers in this country. Since 1954, the United States has shipped 300 million tons of food aid to developing countries—although in the early years, Western Europe and Japan were significant recipients—to provide emergency disaster relief, long term economic development assistance, and improved nutritional programs.

Another important aspect of the P.L. 480 program is that many former recipients are now commercial markets, the most celebrated one being Japan. As a result of the rapid expansion in commercial sales during the 1970's, concessional sales, which accounted for one-third of agricultural exports in the late 1950's, are now less than 5 percent of the total.

Key Element in the World Food Supply-Demand Balance

The United States is primarily a residual supplier of raw agricultural materials to the world. Since the mid-1920's, there has been a gradual shift in the composition of U.S. agricultural exports. Cotton dominated as late as the 1940's, supplying the world with raw materials for textile production. Following World War II, U.S. food shipments provided relief to much of war-torn Europe and Asia. This aid was expanded in the mid-1950's with the advent of Public Law 480. Food since that time has constituted the major share of U.S. farm exports. In the early 1960's, however, most developed and some developing countries intensified their livestock feeding practices, purchasing more U.S. grains, protein meal and other feeds for animal rations. Today, half of U.S. farm exports are for direct food use—wheat, rice, fruits, vegetables and meat—while over a third go for feed use and other farm inputs such as breeder cattle, and the remainder are raw materials used in industrial processes, such as textile, cigarette and shoe production.

The world food supply and demand balance showed signs of a major shift in the early 1970's. A global population growth rate of 1.9 percent was adding roughly 65 million new mouths to feed each year, and much of that increase was in low-income developing countries. At the same time, rapid income growth was fueling demand for improved diets in most of the industrialized and a number of the high-income developing countries. This

increase in effective demand could only be met by suppliers—such as the United States—who were able to expand production without putting unnecessary strain on the remainder of the economy. Such a strain would show up in significant price increases, the result of having to outbid the rest of the economy for resources.

The United States is a reliable supplier of food. It is capable of filling the needs of any one country with expedience and a quality product, given the rigorous U.S. inspection requirements. This is one reason why the United States is the world's largest supplier of agricultural products accounting for 18 to 20 percent of the value of world agricultural trade. In terms of volume, the United States shipped 162 million tons of agricultural products overseas in 1981, or nearly 40 percent of the world's total. This dramatic increase in market share is due to the predominance of low-value, bulk commodity exports such as grains and oilseeds.

The Recent Decline

During the 1970's there were major shifts in U.S. agricultural exports, as foreign demand rose sharply. Fueled by economic growth, expanded world liquidity, and policy changes in various markets, demand for food imports increased and U.S. production and exports of basic foods and feeds met the foreign deficit. During the decade U.S. wheat, soybean and meal exports doubled while feedgrain exports tripled. The USSR and China became our major grain markets and the European Community our major soybean market.

World Wide Recession

The world fell into a deep recession in 1981, which slowed growth in world trade. With high real interest rates and real rates of return on capital, the U.S. dollar appreciated (in real terms) by 10 percent in 1981 and another 9 percent in 1982. This appreciation acted as a tax on U.S. exports, further eroding the competitiveness of U.S. products overseas. As a result of the worldwide economic slowdown and the dollar appreciation, many countries eventually had to reduce or alter their food consumption which, in turn meant reducing U.S. food imports. Indirectly, the demand for grains and other feedstuffs used in animal feeds was lowered, reflecting lower meat demand.

1981 saw the confluence of a number of factors that had a negative affect on U.S. farm exports. Those mentioned above slowed the demand for food, but do not tell the whole story. Economic conditions in certain countries became so bad that the ability to pay for food—whether directly as food or indirectly as feedstuffs—was seriously in doubt. The foreign exchange necessary for many countries in Africa, Latin America, and Asia to purchase goods was unavailable as their own export prices were falling, lowering revenues and limiting their ability to import. With the world economic pie growing smaller, impacting negatively on employment and income, several countries attempted to insulate the domestic market from the international market through various forms of protectionism such as tariffs and quotas. The agricultural sector was not immune from this action.

Finally, policy decisions in the world's foremost Centrally planned countries are playing a pivotal role, particularly in the grain market. Governments determined the level of and source of imports in these countries. The Soviet Union and China lowered their purchases from a

combined total of 23 million tons in fiscal 1982 to 11 million in 1983. Although China did have a record wheat crop, both countries consciously intended to lower the U.S. market share.

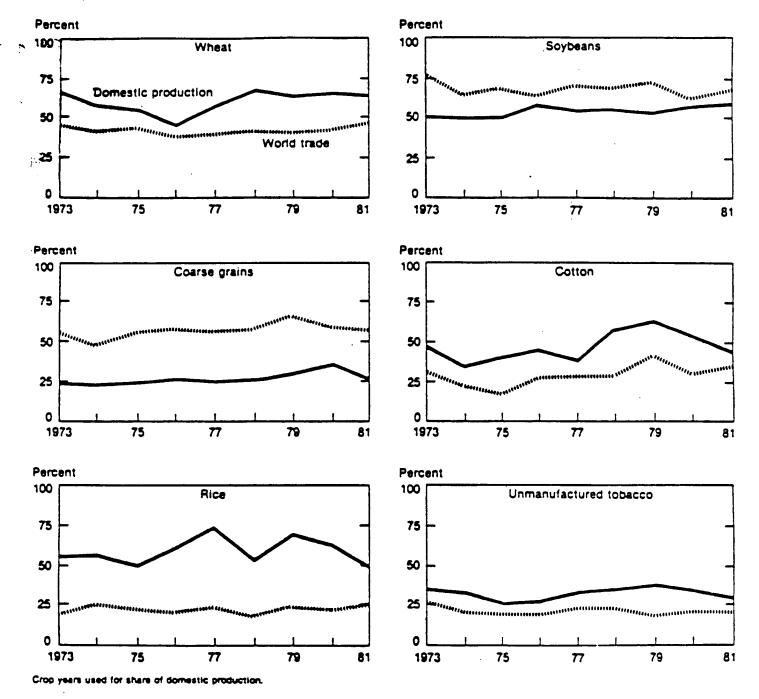

While both economic factors and policy decisions adversely affected U.S. exports, abundant supplies in competitor countries added to the problem. Though no new major competitors have entered, price and credit competition strengthened as record Canadian wheat exports moved this year and both Argentina and the European Community offered financial incentives to increase foreign wheat sales and minimize domestic stockbuilding. The rising value of the dollar in many commodities has offset the declining U.S. prices and allowed competitors to capture sales. Without recent large credit programs for U.S. exports, to counter those of some competitors and to offset extreme financial constraints in several markets, our shipments this year would have been worse.

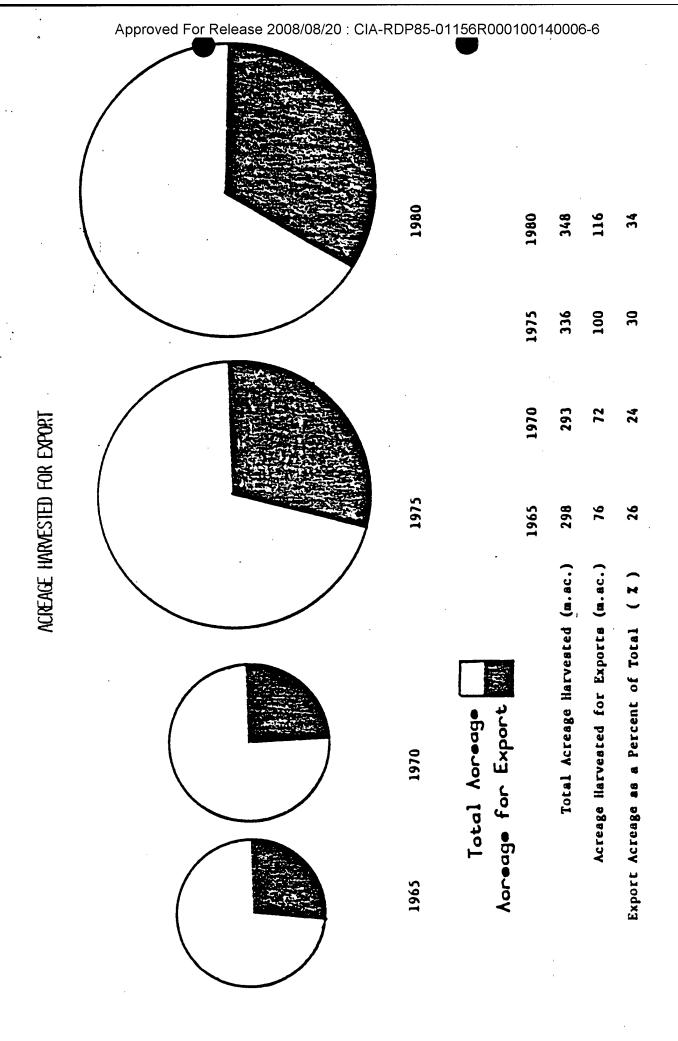

Agricultural export prospects for the next year are brighter because of an expected world economic recovery, recent policy agreements on grains with the Soviet Union and textiles with China, and reduced competitor supplies in some commodities. Higher prices should boost the value of agricultural exports. However, the strong dollar and still-weak demand for livestock products could temper the immediate outlook for U.S. exports of foods, feeds and fiber. In the mid-to-late-1980's, U.S. exports are expected to rise with population and income growth abroad, However, the annual expansion in U.S. exports for the decade of the 1980's is expected to be at less than half the rate of the 1970's.
